Exploring Managed Network Services Solution Offerings

WAN Managed and Monitored Broadband Services

WAN Managed and Monitored Broadband Services adds industry leading Network Performance Monitoring and automated ticketing for enhanced issue resolution and can include VPN Services to your technology estate. With applications becoming more data intensive and mission critical, it's important to manage and optimize your precious bandwidth. Utilizing DPS's monitoring on all your remote devices, to determine endtoend performance characteristics, will allow for real time remediation. Keeping your technology estate's health in focus DPS recommends provisioning an additional managed and monitored circuit to your technology estate and can enable SDWAN to support load balancing and traffic prioritization, if desired. This solution also increases your uptime availability, with automatic failover and almost seamless transition between circuits. With the pandemic that has occurred in 2020, we are all reminded that network availability is critical to the ongoing operations of businesses across the country. Our goal is to offer fully redundant networks.

LAN Infrastructure Management and Monitoring – Inside the Store, Corporate Offices, Remote Offices and Work from Home Offices

DPS offers reliable device monitoring across your entire network. We can monitor servers, virtualized environments, switches, routers, access points and a variety of hardware whether that hardware sits in your datacenter, corporate office or remote locations, including home offices. Realtime monitoring and alerts using industry leading Network Performance Monitoring allows us to help you identify and resolve network issues quickly to minimize the impact on your business. We offer a variety of options and levels of support that will meet your needs today and can grow as your needs change and your business grows.
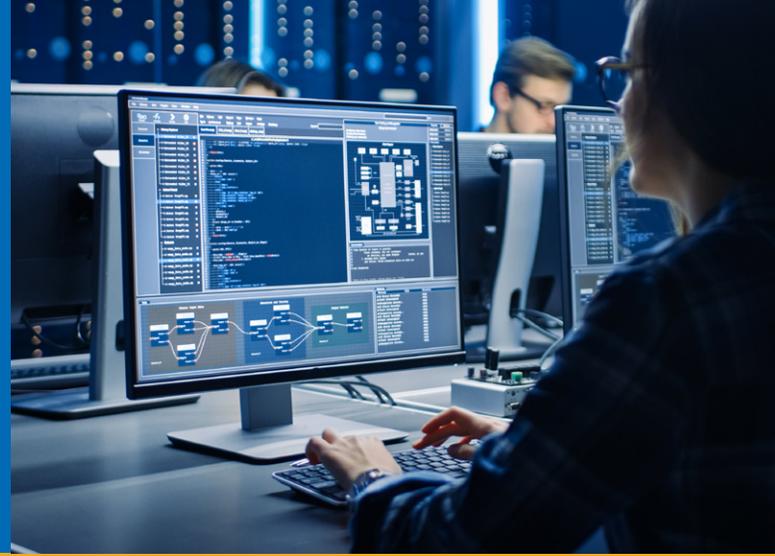

The DecisionPoint Difference

Empowering your workforce with the best technology and the most accurate information to make the right decision at the right time...
the DecisionPoint.

DPS Managed Network Services Portfolio

Get started today!

It's time to get started and offer a truly "usable WiFi" experience and enjoy a highly available WAN. Enhance your end user experience with a best-in-class, comprehensive and customizable portfolio of services.

DPS designs, builds and maintains on your behalf to ensure you get high availability and futureproof scalability.

Everything you need to create the ultimate high-performance network technology environment.

Exploring Managed Network Services Solution Offerings

WAN Managed and Monitored Cellular Broadband Services – For a Reliable Backup Network Connection

A Cellular Broadband backup connection provides peace of mind by delivering an "always on" network for your offices or stores. We use industry leading cellular routers to create a secure connection that will keep business running 24x7x365. If your primary circuit goes down for any reason, the network will seamlessly transition to the cellular backup to keep your business running smoothly. We match your business needs with affordable plans from major cellular providers. We can deploy 5G ready devices to future proof your network and offer a "fast start" service to provide connectivity while you wait for a new circuit to be installed. From start to finish, we can design, deploy and monitor a reliable cellular broadband network for all your business needs.

Wi-Fi Services

DPS WIFI Services bring you the best controllerless cloudbased WiFi connectivity available in market today. Each Access Point is its own master with integrated cloud services architecture managing security, policy or access control changes. This cloudbased model enables enterprises to increase capacity quickly without making large upfront capital investments in additional servers, storage, and networking infrastructure. It provides flexibility, scale and lower cost. If controllerless based connectivity isn't achievable today, DPS can leverage your onpremise architectures by assisting in the design, deployment and management of your WiFi network.
